

A Source chunk c

conditioning bundle
 $E_c = (T_c, L_c, I_c)$:
recognised text T_c ,
structure L_c , hash-bound
image census I_c

B Arm prompt π_a

the only quantity that
varies across arms:
ECM contract, direct,
structured no-contract;
 g , schema, decoding fixed

C Contracted call

$y = g(\pi_a, E_c)$, one call:
select quote q , image h ;
plan answer α first;
hold $\tau = (t, q, \alpha, h)$ fixed;
self-check necessity

D Gate $G(y, E_c)$

verify, never repair:
 q verbatim in T_c ,
 $h \in I_c$, type t and
schema exact, MCQ option
equals α

E Blind dual judging

two masked families,
seven-field object,
no provenance violation
and $\min(s_1, s_2, s_3) \geq 3$
 $\Rightarrow$ endpoint $V(c, a) = 1$

returned tuple $\tau(y)$ verified against E_c ; failure is a terminal outcome retained in the ITT denominator
